

• WORDPRESS BLOCK SYSTEM

Warm water, and a site that
is as easy to run as it is to
look at.

CLIENT

EMERALD POOL & PATIO

BUILT AS

BLOCK THEME + BLOCKS PLUGIN

DATE

22 SEPTEMBER 2026

- WHAT THIS IS

A base theme and twelve blocks, configured for one brand.

Nothing here is a page builder, and nothing is for sale. Spa models are a custom post type — a marketing catalogue, not a shop — so there is no WooCommerce, no cart, and no checkout to maintain.

- **zngiron-base**

The theme. Every design decision is a theme.json preset; every page section is a pattern.

- **zngiron-blocks**

The plugin. Twelve server-rendered blocks, the spa post type, and the schema output.

- **config/brand.json**

The brand. Name, post types, taxonomies, meta fields and store locations — one file.

- **Editors work in Gutenberg**

The blocks sit in an inserter category named for the brand. No shortcodes, no custom admin screens to learn.

- **Deployment needs no Node**

The compiled blocks are committed. Node is only needed to change the block source.

- **Rebrandable on purpose**

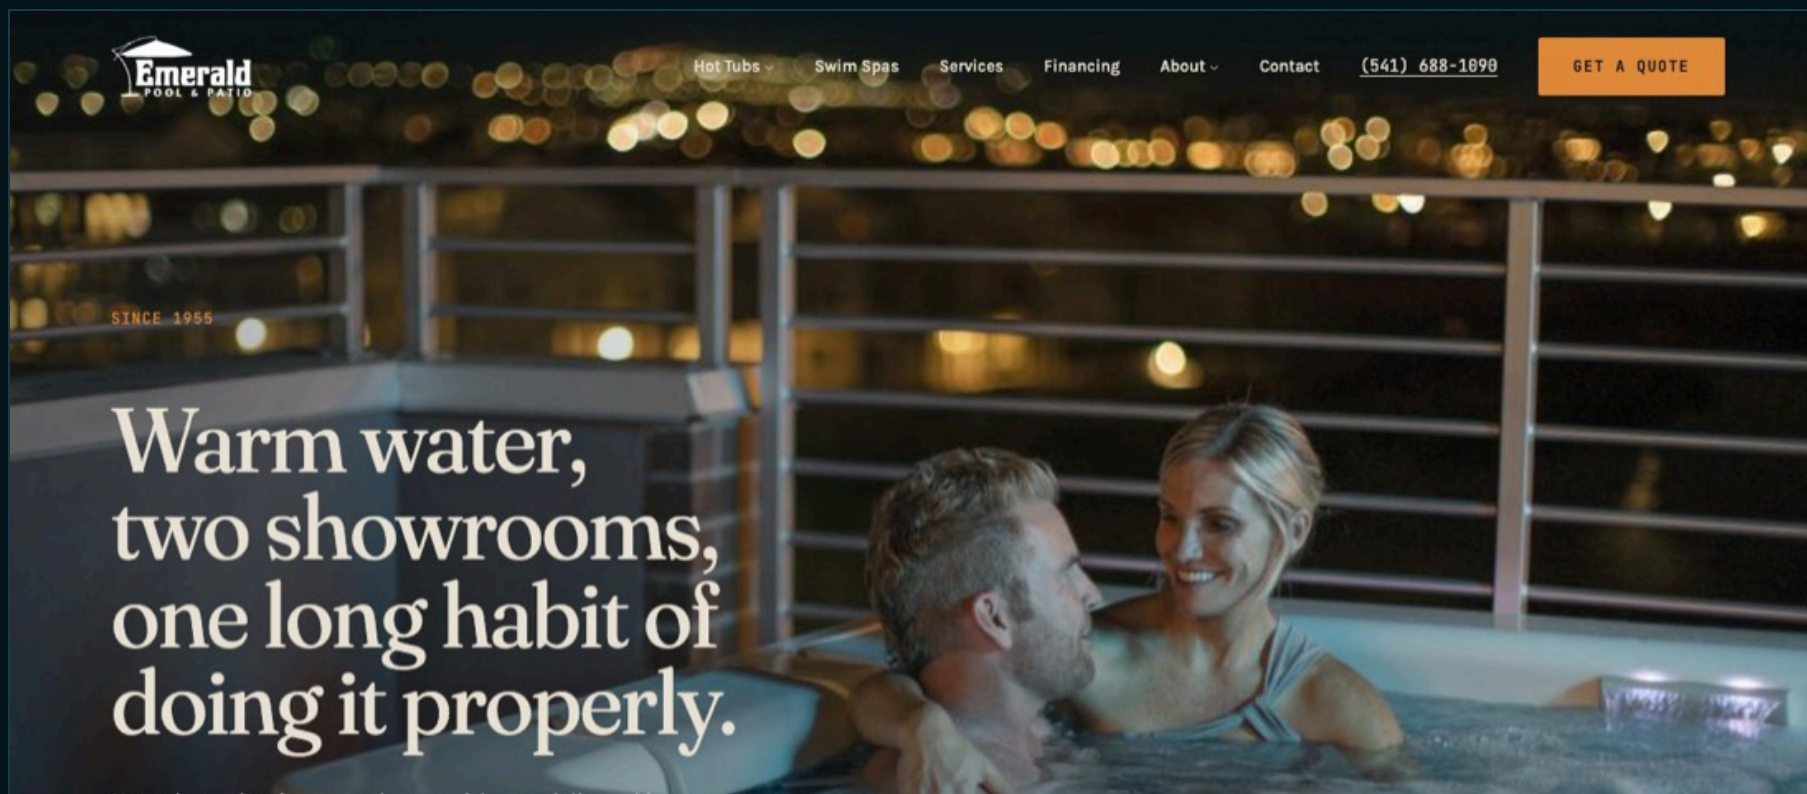

Emerald Pool is the first brand on the system, not the system itself.

What a fresh install builds, unattended.

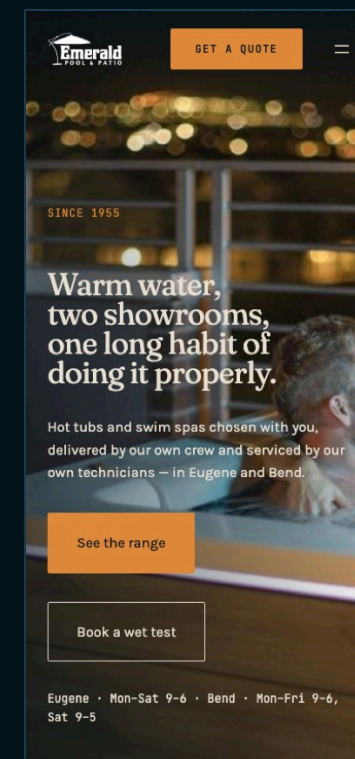

12 CUSTOM BLOCKS	11 PAGES	10 SPA MODELS	33 IMAGES	4 _{cmds} TO SET UP
---------------------	-------------	------------------	--------------	--------------------------------

The seed is files in the repository, not a database dump: page markup, a spa spec sheet, and an image manifest. Running it twice changes nothing but timestamps, so a demo can always be put back the way it started.

One hero, one viewport — on every screen.

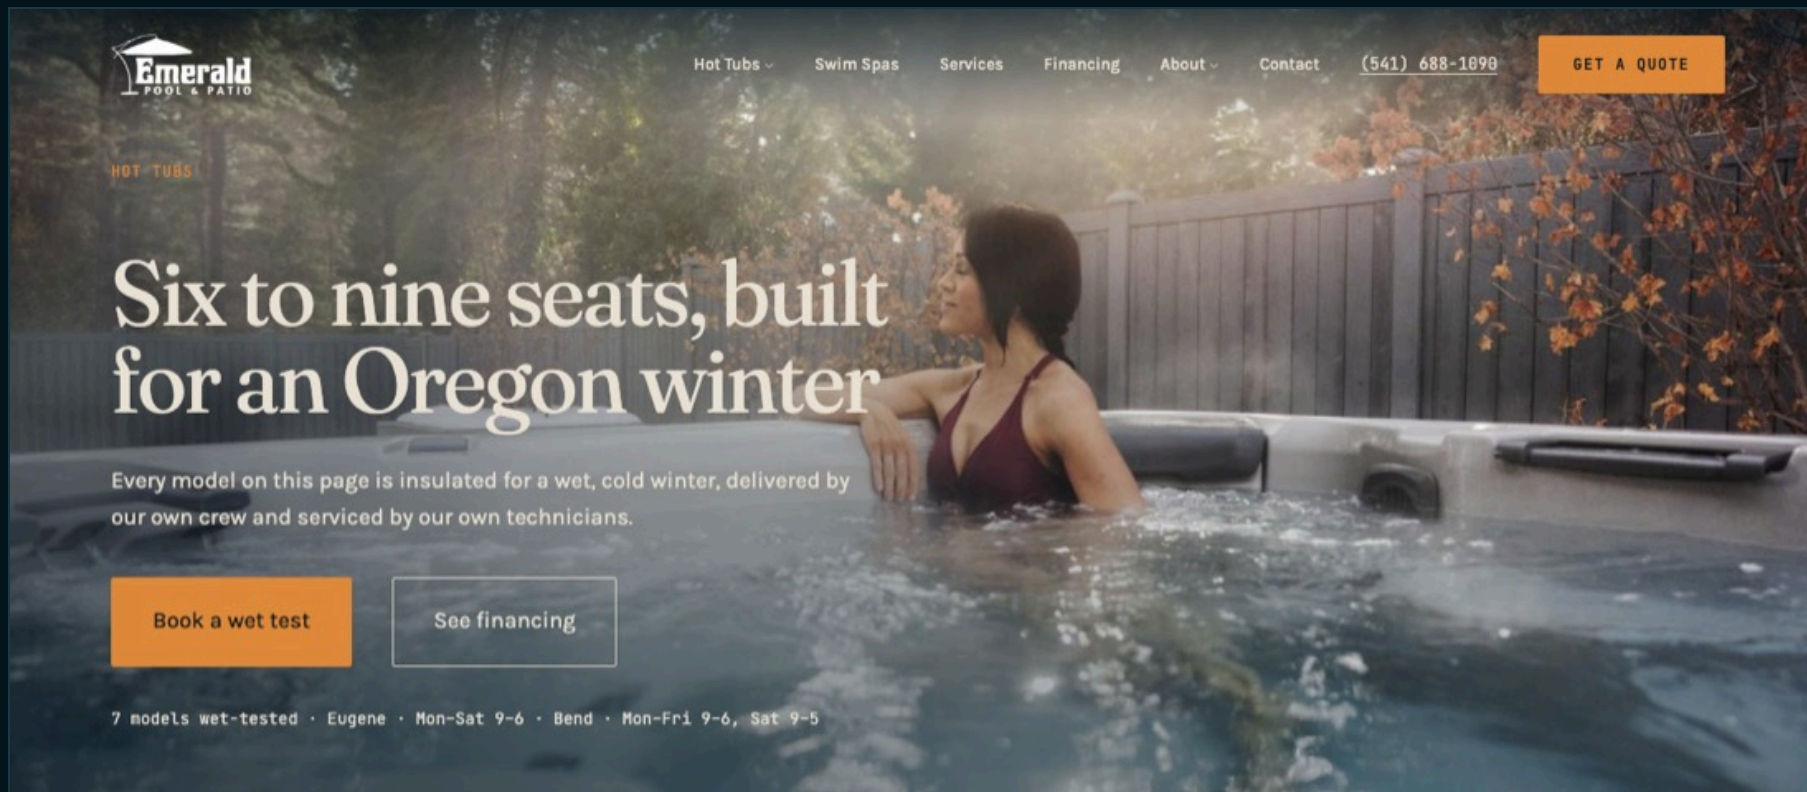

DESKTOP • 1440

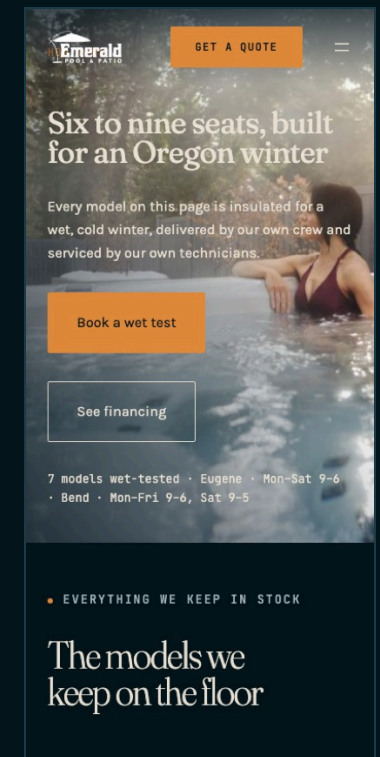

MOBILE • 390

A listing that filters itself from the taxonomy.

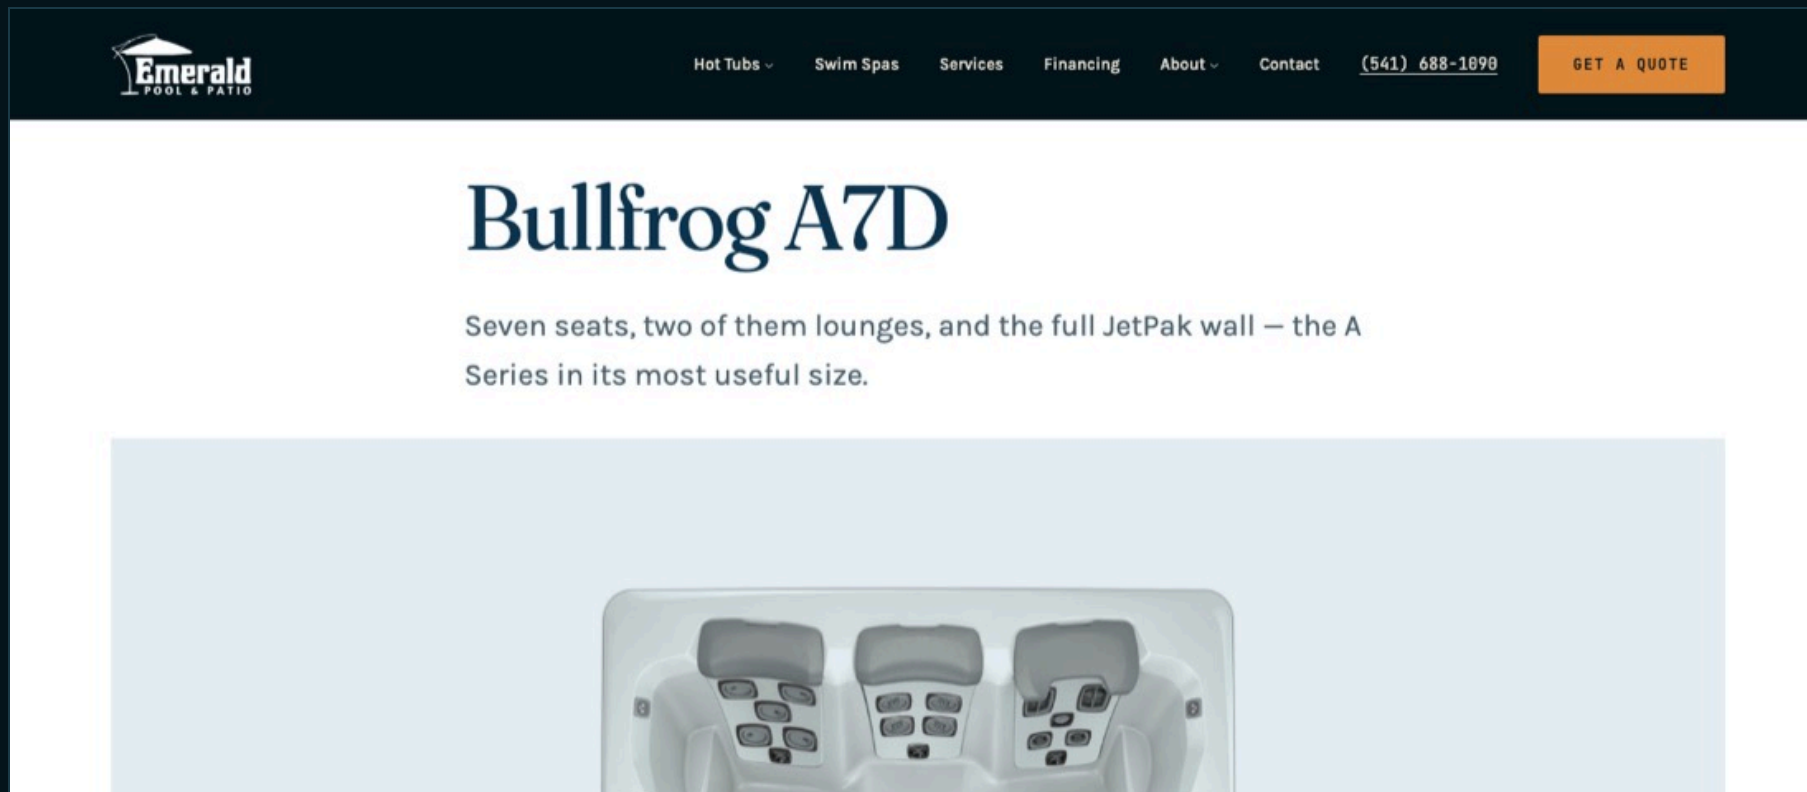

DESKTOP • 1440

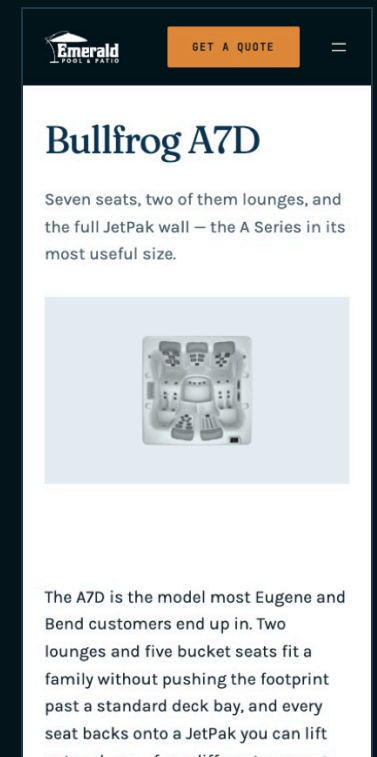

MOBILE • 390

Specifications come from the fields, not from typing.

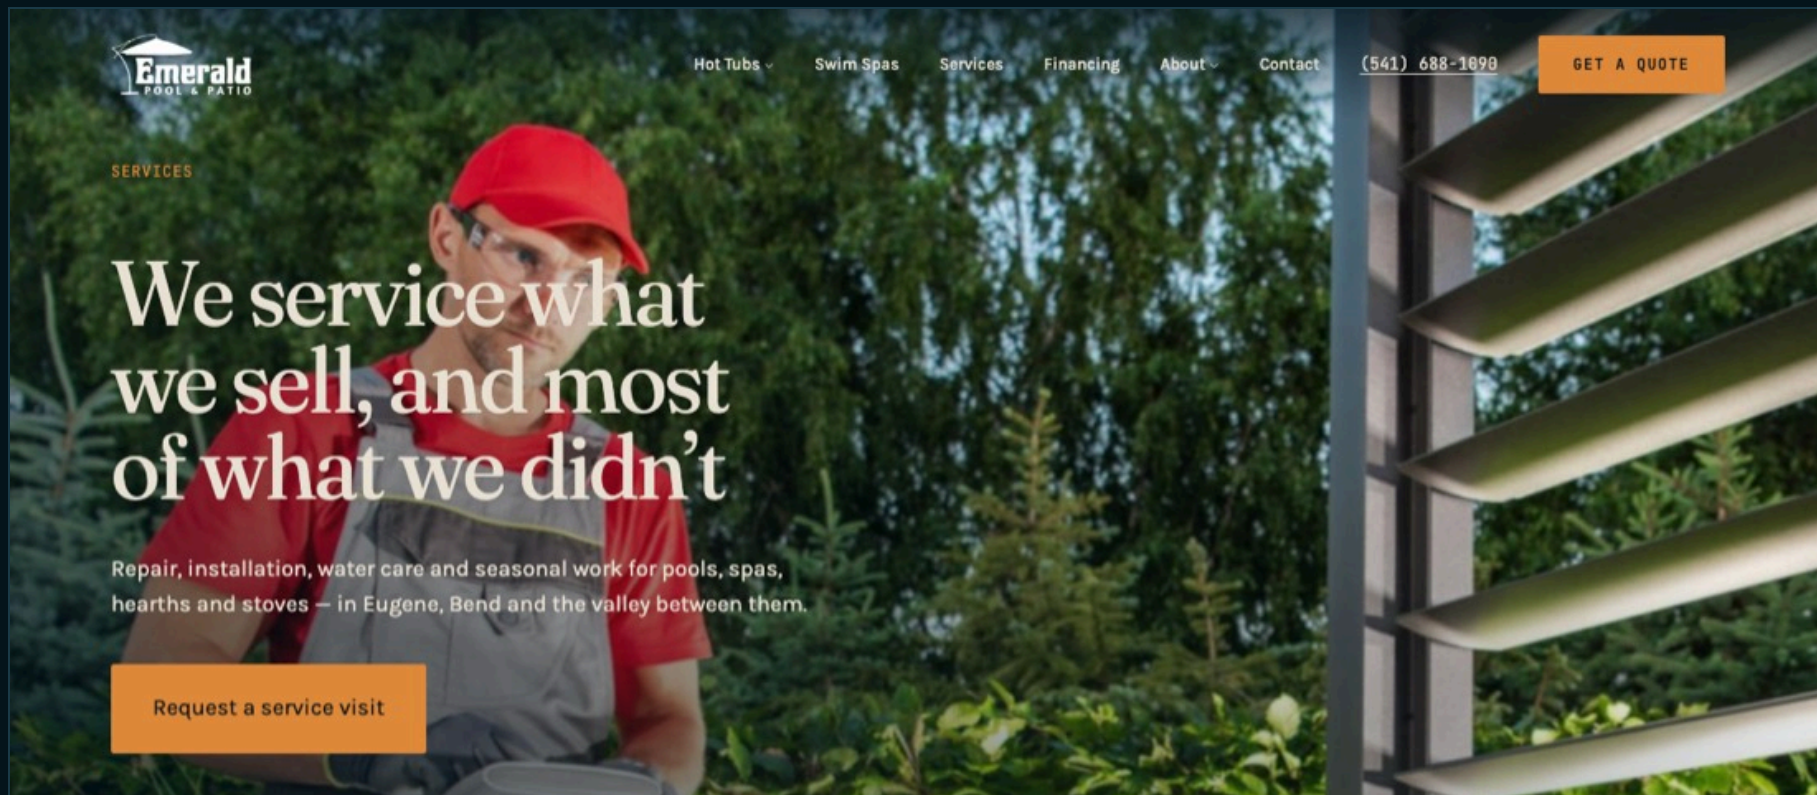

DESKTOP • 1440

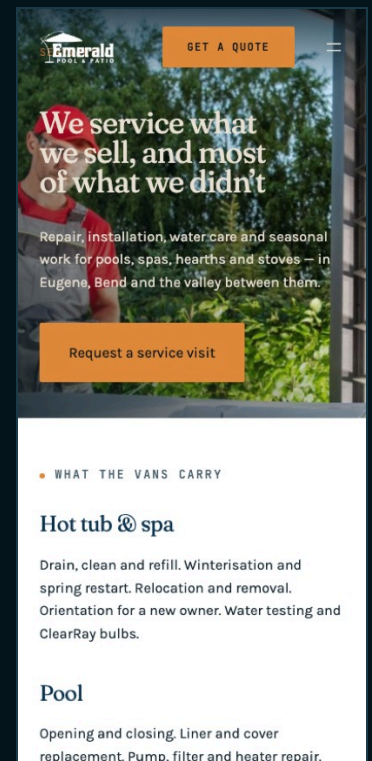

MOBILE • 390

Alternating media and text, on one sizing contract.

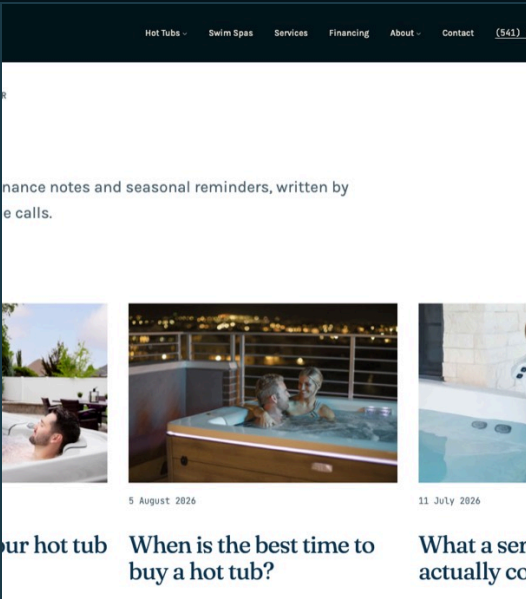

DESKTOP • 1440

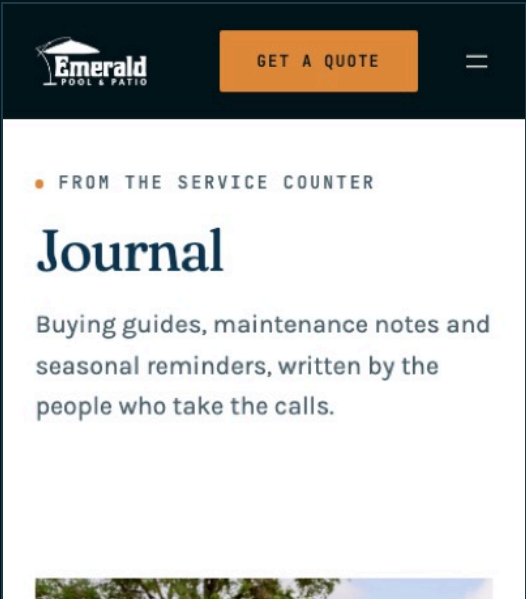

MOBILE • 390

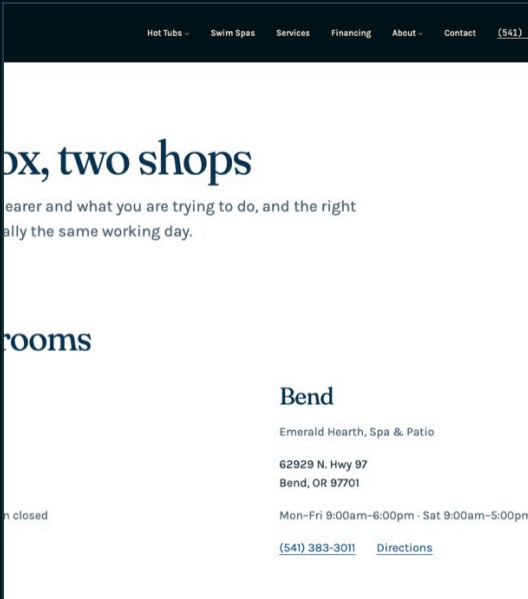

The rest of the site, at both widths.

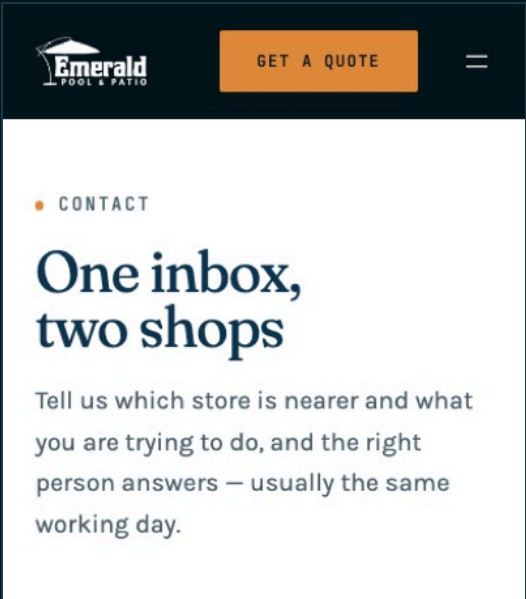

JOURNAL • 1440

JOURNAL • 390

CONTACT • 1440

CONTACT • 390

Twelve, and a reason for each.

01 **Hero**

Full-viewport opener, media behind copy

04 **Card Grid**

Two to four equal-height cards

07 **Compare Table**

Two or three models side by side

10 **FAQ**

Questions, and the schema for them

02 **Media Text**

Image beside copy, either side

05 **Post Grid**

Any post type, with filter chips

08 **Stats**

Counted figures in a band

11 **Locations**

Showrooms, from brand.json

03 **Card**

One card; the grid's child

06 **Specs Table**

Rows from the declared meta fields

09 **Testimonials**

Quotes, with attribution

12 **Marquee**

A moving line of short claims

Adding a specification is editing one file.

The spa post type, its two taxonomies and its eleven meta fields are declared in `config/brand.json`. A field flagged **specs** becomes a row in the Specs Table; a field flagged **compare** becomes a row in the Compare Table. Neither block is edited to add one.

POST TYPE	spa — 10 models
TAXONOMIES	Type (2 terms), Series (6 terms)
META FIELDS	11, of which 9 in specs and 6 in compare

```
{  
  "key": "spa_jets",  
  "label": "Jets",  
  "type": "integer",  
  "specs": true,  
  "compare": true  
}
```

Four commands, and nothing installed on the machine.

```
# once
cp .env.example .env

# start wordpress + mariadb
make up

# install, activate, permalinks
make install

# images, spas, pages, posts
make seed
```

Everything runs in containers, under Docker or OrbStack. No PHP, no MySQL and no Node are installed on the host. The first run pulls the images; after that it is seconds.

SITE	http://localhost:8080
ADMIN	/wp-admin — admin / admin
START OVER	make reset, then make seed

• VERIFIED

Checked on a clean clone, not on the machine it was built on.

✓	Clone, start, install, seed — the whole path, on an empty database	132 pages
✓	Every internal link and image crawled: none broken, none a placeholder	206 urls
✓	axe-core colour contrast at AA, two widths and two scroll positions	0 violations
✓	Layout assertions: no overflow, one nav row, hero exactly one viewport	87 stops
✓	Blocks registered and rendering, each with a working editor preview	12 of 12

What the second brand costs.

- **Edit config/brand.json**

Name, post types, taxonomies, meta fields, locations.

- **Edit theme.json**

Palette, type scale, spacing. No template touched.

- **Replace the assets and the seed copy**

Images, the media map, and the page markup.

Before this goes live, three things belong on the list: a contact form and where its mail goes, a staging host, and a decision on whether the footer should carry the social links the brand file already declares.
